## Embedded Systems Laboratory

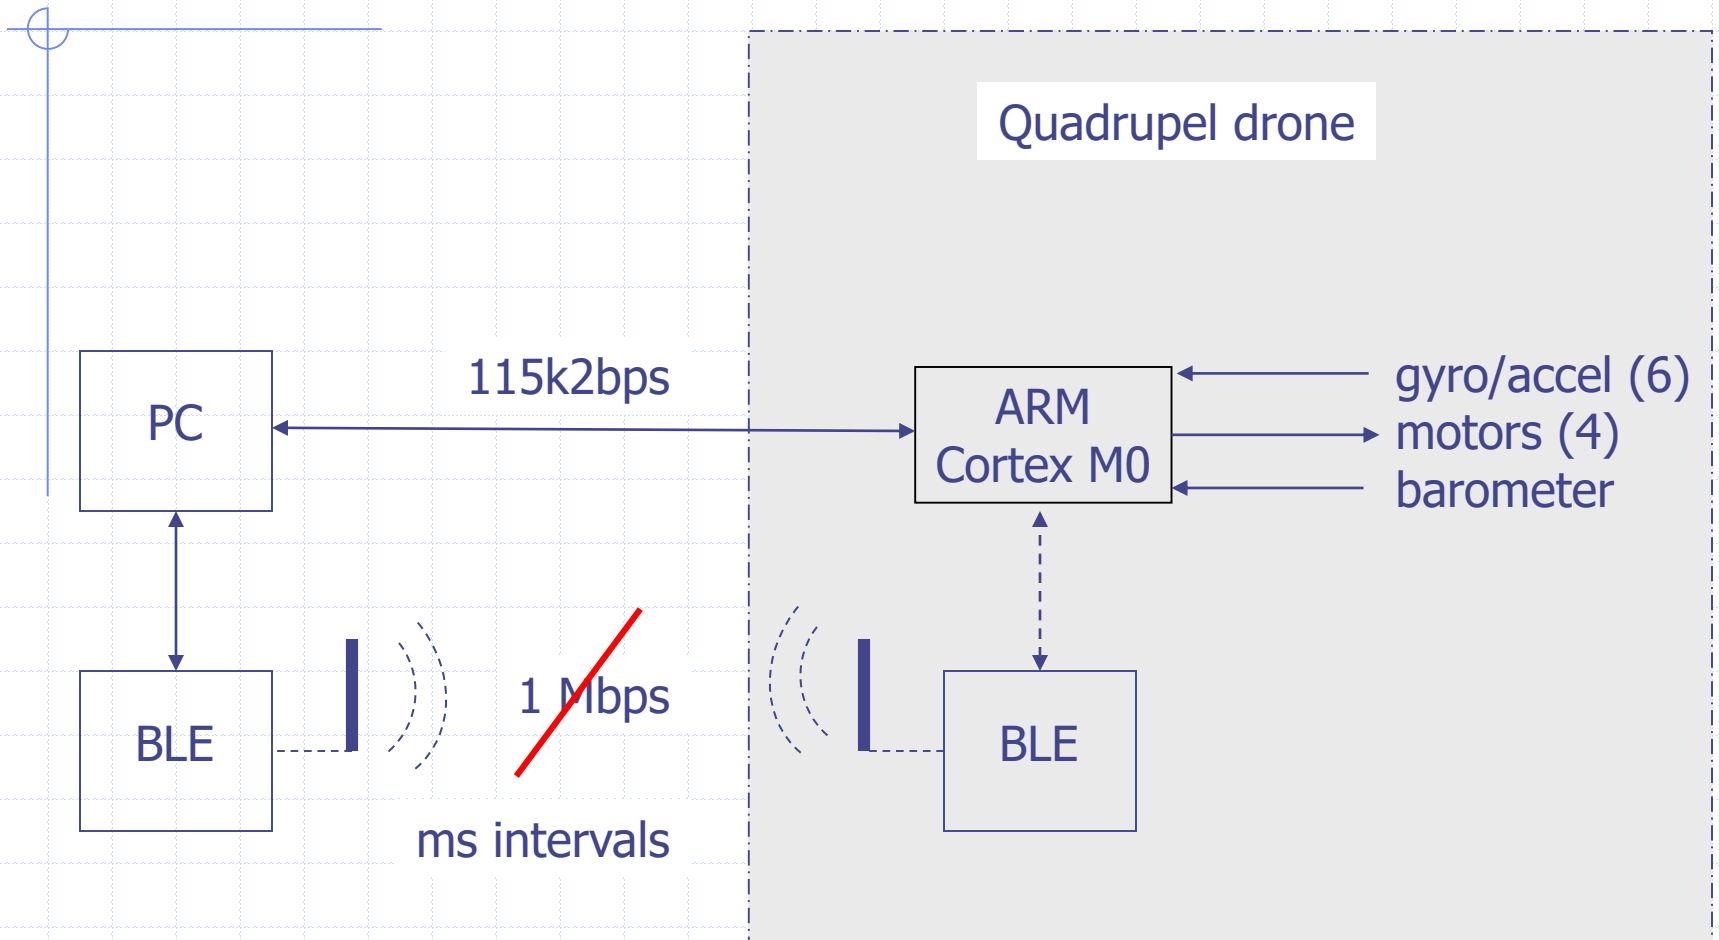

Electrical Model Quad Rotor UAV

# System Setup

(source: assignment.pdf)

# HW view

# Drone: Frames & Main Variables

# Drone attitude: Euler Angles

rotation order  $\psi, \theta, \Phi$

# Drone: Forces

Forces:  $X, Y, Z$   
Moments:  $L, M, N$

# Drone: Actuators

rotor 1 – rotor 4  
through RPM,  
denoted by  $\Omega$

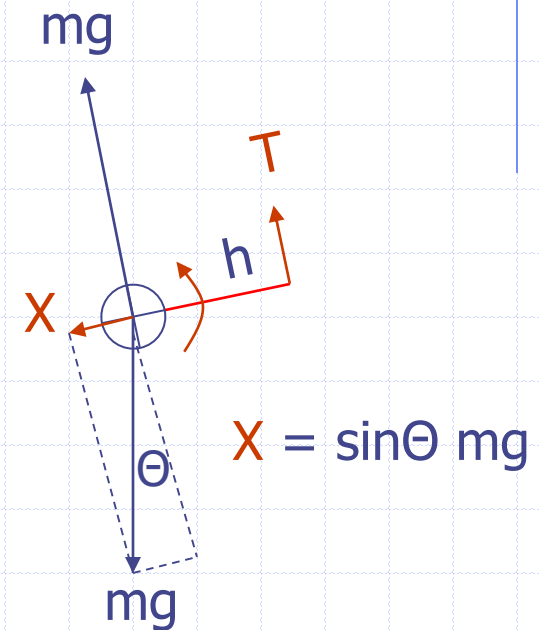

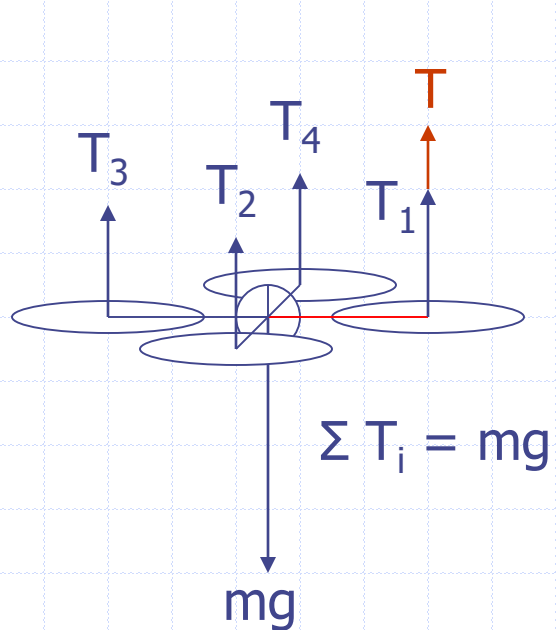

driven by ES signals  
 $ae1 - ae4$

$ae = 0 \rightarrow \Omega = 0$

$ae = 1000 \rightarrow \Omega = \max$

# Drone: Dynamics (in hover)

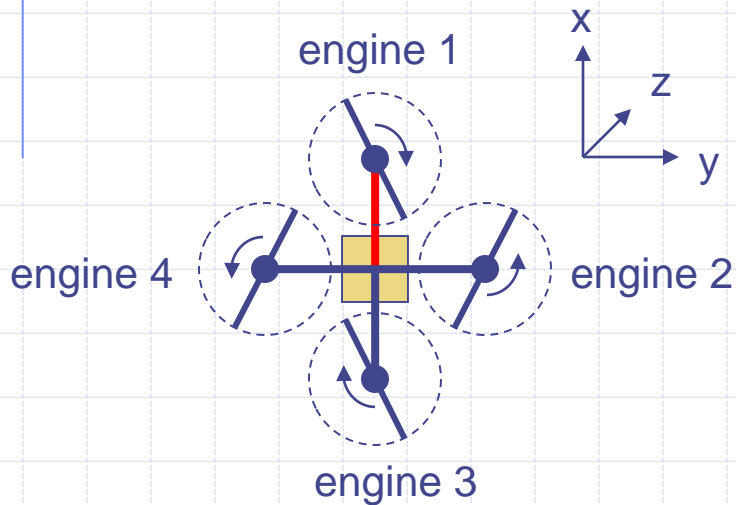

$T_i = \text{rotor thrust} = f(\Omega_i)$   
 $mg = \text{gravity}$   
 $h = \text{rotor distance ref. center of gravity}$   
 $I_Y = \text{heli rotation inertia in Y-axis}$

$dq/dt = M / I_Y$   
 $du/dt = X / m$   
 accelerated  
 rotation & xlation!

# Drone: Rotor Actuators

In general

$$Z = -b(\Omega_1^2 + \Omega_2^2 + \Omega_3^2 + \Omega_4^2)$$

$$L = b(\Omega_4^2 - \Omega_2^2)$$

$$M = b(\Omega_1^2 - \Omega_3^2)$$

$$N = d(\Omega_2^2 + \Omega_4^2 - \Omega_1^2 - \Omega_3^2)$$

So compute  $\Omega_i$  (i.e.,  $ae_i$ ) from desired lift ( $Z$ ), roll rate ( $L$ ), pitch rate ( $M$ ), and yaw rate ( $N$ )

# Drone: Sensors (angles)

Gyro:

$p, q, r$

Accelerometer:

$a_x, a_y, a_z$

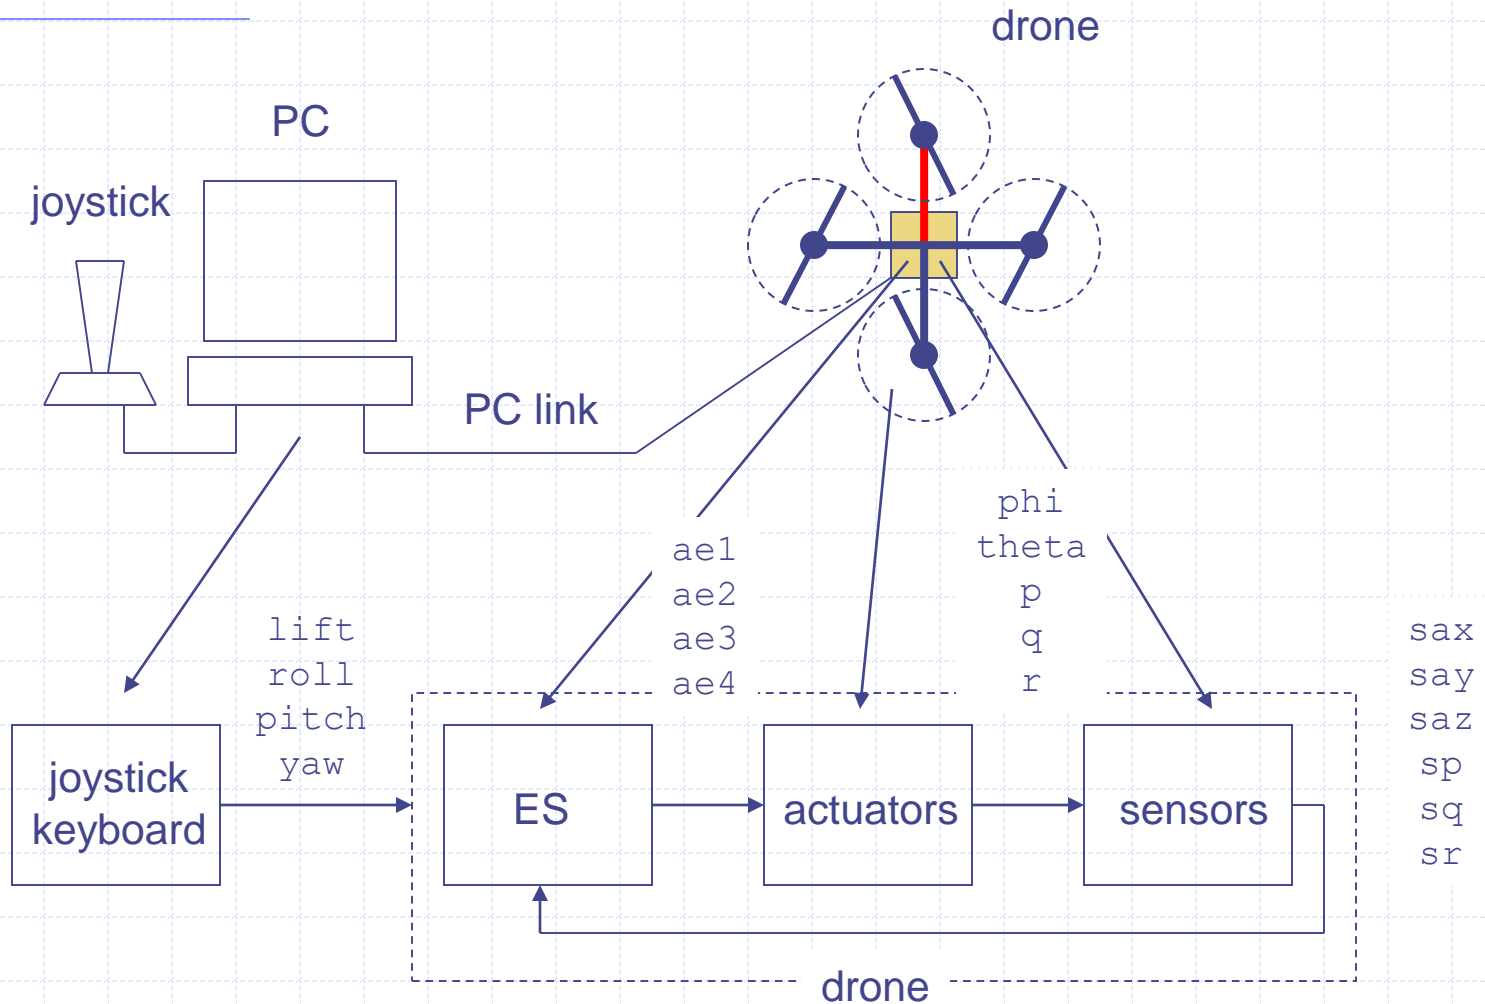

$$a_x = \sin\theta g \sim \theta g$$

# Drone: Sensors (angles)

# SW view

# Communication protocol (lab 1)

## ◆ PC -> Drone (send)

- periodic: pilot control
- ad hoc: mode changing, param tuning

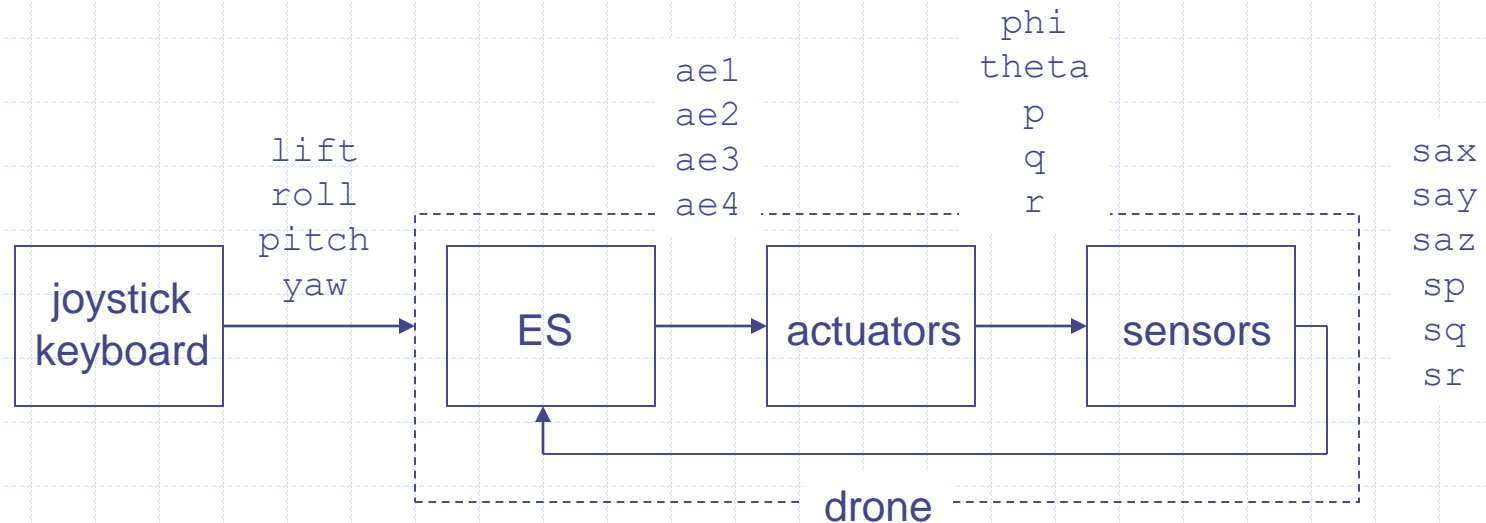

## ◆ Drone -> PC (receive)

- periodic: telemetry (for visualization)
- ad hoc: logging (for post-mortem analysis)

## ◆ Dependable, robust to data loss

- header synch

# Drone: Control Circuit

control loop example (yaw **rate**):

```
eps = yaw - sr;
```

```
N_needed = P * eps;
```

```
ae1 .. ae4 = f(N_needed);
```

```
// measure deviation
```

```
// compute ctl action
```

```
// actuate, see slide 9
```

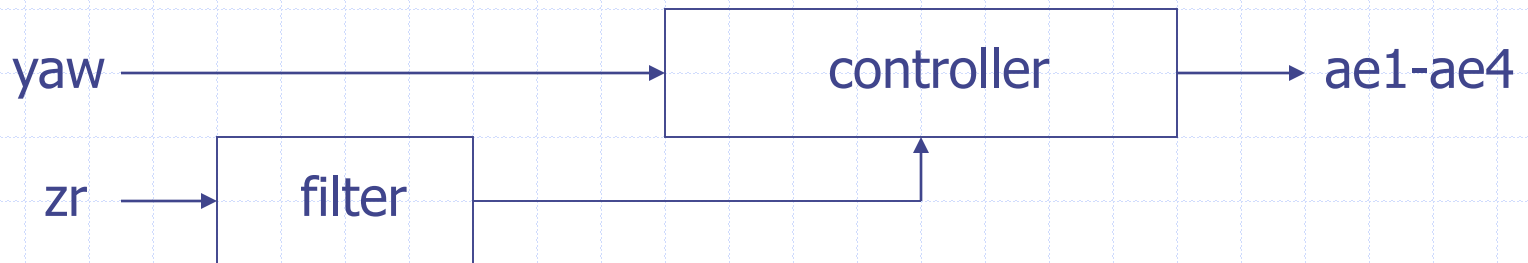

# Calibration

- real  $p, q, r, \dots$  are sensed in terms of  $s_p, s_q, s_r, \dots$
  - $s_p, s_q, \dots$  have a (voltage) bias (are not zero at rest)
  - so need to calibrate all 6 sensors at rest:
    - let  $sr_0$  be sensor output at rest
    - real estimate of  $r$  are given by (z for zeroed)
- $$z_r = s_r - sr_0$$

# Filtering

- signals also need to be *filtered* to remove noise
- filtered signal input to embedded controller

# Controller Modes

- controller mode: manual
- controller model: calibrate
- controller mode: control (yaw, pitch, roll)

# Before you go

Safety first:

- goggles
- common sense
