## Exam TI2720-C/TI2725-C Embedded Software

Thursday July 3 2014 (14.00 - 17.00)

Koen Langendoen

In order to avoid misunderstanding on the syntactical correctness of code fragments in this examination, we will always assume that we are dealing with pseudo-code, although we might have syntactically correct code in some cases. We assume that the required variables, semaphores, tasks, timers, etc. are always declared and initialized correctly.

Further, we assume the following abbreviations to be known:

- RR = Round Robin,
- RRI = Round Robin with Interrupts,
- FQS = Function Queue Scheduling,
- RTOS = Real-Time Operating System,
- IR = interrupt and
- ISR = interrupt service routing.

In this exam, we use the following definitions, unless stated otherwise:

```
void delay(int ms) {
    !! do some CPU computation for ms milliseconds
}
void putchar(char c) {
    while (!! UART tx buffer not empty);
    !! send c to UART tx buffer
}
void puts(char *s) {
    !! print string s using putchar
}
```

To pass this written exam, you need to correctly answer at least 20 questions. The relationship between the number of correctly answered questions and your mark is given below.

#correct	≤ 8	9	10	11	12	13	14	15	16	17	18	19
Mark	1	1.5	2	2.5	3	3	3.5	4	4.5	5	5	5.5

#correct	19	20	21	22	23	24	25	26	27	28	29	30
Mark	5.5	6	6.5	7	7	7.5	8	8.5	9	9	9.5	10

Question 1           Embedded programming is in essence more difficult than "classical" programming because of <ol></ol>	
a. the lack of recursion b. the event-based programming model c. the thread-based programming model d. none of the above Question 2 Which of the following statements is correct? Using interrupts improves a. task response time b. memory response time c. system response time d. processor retrical section d. disable a critical section Question 4 How can a low priority task prevent itself from being interrupted by a high priority task? a. By y using critical sections c. By disabling retrieurupts d. By disabling retrieurupts d. By disabling the interrupts Question 5 Which of the following statements is correct? An interrupt service routine is supposed to a. clear the context to disk upon entrance d. restore the context and return c. save the context to disk upon entrance d. estore the lowest-priority interrupt and return Question 6 The primary shortcoming for RRI architecture is: a. all the tasks have the same priority b. it is more complex than RR c. critical sections to used d. the memory footprint increases Question 7 Which of the following statements is correct? An interrupt service routine a. must not reference ejobal variables (chared data problem) d. must be written in assembler (to avoid compler optimizations) d. must be written in assembler (to avoid compler optimizations) d. must not call outines that perform I/O	
<ul> <li>b. the event-based programming model</li> <li>c. the thread-based programming model</li> <li>d. none of the above</li> <li>Question 2</li> <li>Which of the following statements is correct? Interrupts can be disabled in order to</li> <li>a. protect a critical section</li> <li>b. endow context switches</li> <li>c. protect a critical section</li> <li>d. disable a critical sections</li> <li>c. protect other interrupts</li> <li>d. disable a critical sections</li> <li>b. endow context switches</li> <li>c. protect other interrupts</li> <li>d. disable a critical sections</li> <li>b. By using critical sections</li> <li>c. By using critical sections</li> <li>d. by avoiding critical sections</li> <li>e. By using critical sections</li> <li>b. By avoiding critical sections</li> <li>c. By using interrupts</li> <li>d. disable a critical sections</li> <li>c. By using interrupts</li> <li>d. disable a critical sections</li> <li>d. by disabling the interrupts</li> <li>d. disable a critical sections</li> <li>e. By avoiding critical sections</li> <li>b. prostore the context and return</li> <li>c. ave the context op entrance</li> <li>d. restore the lowest-priority interrupt and return</li> <li>Cuestion 5</li> <li>The primary shortcoming for RRI architecture is:</li> <li>a. all the tasks have the same priority</li> <li>b. it is more complex than RR</li> <li>c. critical sections must be used</li> <li>d. the memory foctprint increases</li> <li>Question 8</li> <li>Which of the following statements is correct? An interrupt service routine</li> <li>a. must not reference global variables (shared data problem)</li> <li>b. must be written in assembler (to avoid compiler optimizations)</li> <li>c. critical sections must be used</li> <li>d. the memory foctprint increases</li> <li>Question 8</li> <li>W</li></ul>	Embedded programming is in essence more difficult than "classical" programming because of
C. the thread-based programming model d. none of the above Question 2 Which of the following statements is correct? Using interrupts improves a. task response time b. memory response time Cuestion 3 Which of the following statements is correct? Interrupts can be disabled in order to a. protect a critical section L. enable context switches c. protect other interrupts d. disable a critical section Cuestion 3 Which of the following statements is correct? Interrupts can be disabled in order to a. protect a critical section Cuestion 3 Which of the following statements is correct? Interrupts can be disabled in order to a. protect a critical section Cuestion 4 How can a low priority task prevent itself from being interrupted by a high priority task? a. By using critical sections C. By enabling interrupts C. By enabling interrupts Cuestion 5 Which of the following statements is correct? An interrupt service routine is supposed to a. clear the context point entrupts Cuestion 6 Which of the following for RRI architecture is: a. all the tasks have the same priority b. it is more complex than RR c. critical section for RRI architecture is: a. all the tasks have the same priority b. it is more complex than RR c. critical sections must be used c. the more of all columing statements is correct? An interrupt service routine a. must not reference global variables (shared data problem) b. must be written in assembler (to avoid compler optimizations) c. must not call routines that perform I/O cuestion 7 Which of the following statements is correct? The shared data problem can be solved through c. must not call routines that perform I/O cuestion 7 Which of the following statements is correct? The shared data problem can be solved through c. must not reference global variables (shared data problem) c. must be written in assembler (to avoid compler optimizations) c. RR d. RR d. RTOS Cuestion 7 Which of the following statements is correct? The shared data problem can be solved through a. using semaphores b. enabling interrupts c	a. the lack of recursion
d. none of the above         Question 2         Which of the following statements is correct? Using interrupts improves         a. task response time         b. memory response time         c. processor response time         Question 3         Which of the following statements is correct? Interrupts can be disabled in order to         a. protect a critical section         b. enable context switches         c. protect a critical section         Question 4         How can a low priority task prevent itself from being interrupted by a high priority task?         a. By using critical sections         c. By disabling interrupts         Question 5         Which of the following statements is correct? An interrupt service routine is supposed to         a. clear the context and return         Cuestion 5         Which of the following statements         c. restore the context and return         c. as we the context and return         c. restore the context and return         c. restore the lowest-priority interrupt and return         Question 6         The primary shortcoming for RRI architecture is:         a. all the tasks have the same priority         b. it is more complex than RR         c. critical sections must be used         d. the memor	b. the event-based programming model
d. none of the above         Question 2         Which of the following statements is correct? Using interrupts improves         a. task response time         b. memory response time         c. processor response time         Question 3         Which of the following statements is correct? Interrupts can be disabled in order to         a. protect a critical section         b. enable context switches         c. protect a critical section         Question 4         How can a low priority task prevent itself from being interrupted by a high priority task?         a. By using critical sections         c. By disabling interrupts         Question 5         Which of the following statements is correct? An interrupt service routine is supposed to         a. clear the context and return         Cuestion 5         Which of the following statements         c. restore the context and return         c. as we the context and return         c. restore the context and return         c. restore the lowest-priority interrupt and return         Question 6         The primary shortcoming for RRI architecture is:         a. all the tasks have the same priority         b. it is more complex than RR         c. critical sections must be used         d. the memor	c. the thread-based programming model
Which of the following statements is correct? Using interrupts improves         a. task response time         b. memory response time         c. system response time         d. processor response time         Question 3         Which of the following statements is correct? Interrupts can be disabled in order to         a. protect a critical section         b. enable context switches         c. protect other interrupts         d. disable a critical sections         E. By using critical sections         c. By using critical sections         c. By enabling interrupts         d. disable a critical sections         c. By enabling interrupts         d. By disabiling the interrupts         d. Question 5         Which of the following statements is correct? An interrupt service routine is supposed to         a. actite the context and return         Question 6         The primary shortcoming for RRI architecture is:         a. all the tasks have the same priority         b. it is more complex than RR         c. critical sections must be used	
Which of the following statements is correct? Using interrupts improves         a. task response time         b. memory response time         c. system response time         d. processor response time         Question 3         Which of the following statements is correct? Interrupts can be disabled in order to         a. protect a critical section         b. enable context switches         c. protect other interrupts         d. disable a critical sections         E. By using critical sections         c. By using critical sections         c. By enabling interrupts         d. disable a critical sections         c. By enabling interrupts         d. By disabiling the interrupts         d. Question 5         Which of the following statements is correct? An interrupt service routine is supposed to         a. actite the context and return         Question 6         The primary shortcoming for RRI architecture is:         a. all the tasks have the same priority         b. it is more complex than RR         c. critical sections must be used	
a. task response time b. memory response time C. system response time C. system response time C. usestion 3 Which of the following statements is correct? Interrupts can be disabled in order to a. protect actitical section b. enable context switches c. protect other interrupts d. disable a critical section Cuestion 4 How can a low priority task prevent itself from being interrupted by a high priority task? a. By using critical sections b. By avoiding critical sections c. By enabling interrupts d. disable a critical sections c. By enabling the interrupts d. By disabling the interrupts d. disable acritical sections c. By enabling interrupts d. By disabling the interrupts d. By disabling the interrupts d. Clear the context upon entrance b. restore the context and return c. save the context to losk upon entrance d. restore the context and return c. save the context to disk upon entrance d. restore the lowest-priority interrupt and return Cuestion 6 The primary shortcoming for RRI architecture is: a. all the tasks have the same priority b. it is more complex than RR c. critical sections must be used d. the memory footprint increases Cuestion 7 Which of the following statements is correct? An interrupt service routine a. must not reference global variables (shared data problem) b. must be written in assembler (to avoid compiler optimizations) c. must neutrin within 100 ms to meet user perception Cuestion 8 Which of the following statements is correct? The shared data problem can be solved through a. Listing stemphores b. enabling interrupts c. using the extent keyword cuestion 9 Which of the following statements holds for the FQS architecture? a. the code length of the lower priority tasks does not affect the execution time of other tasks b. the code length of the lower priority tasks does not affect the execution time of other tasks b. the code length of the lower priority tasks does not affect the execution time of other tasks b. the code length of the lower priority tasks does not affect the execution time of other	
b. memory response time d. processor response time Question 3 Which of the following statements is correct? Interrupts can be disabled in order to a. protect a critical section b. enable context switches c. protect other interrupts d. disable a critical sections Question 4 How can a low priority task prevent itself from being interrupted by a high priority task? a. By using critical sections b. By avoiding critical sections c. By enabling interrupts d. By disabling interrupts d. By disabling the interrupts d. By disabling the interrupts d. By disabling the interrupts d. By disabling interrupts d. By disabling the interrupts d. estore the context and return c. save the context and return duestion 6 The primary shortcorning for RRI architecture is: a. all the tasks have the same priority b. it is more complex than RR c. critical sections must be used d. the memory footprint increases Question 7 Which of the following statements is correct? An interrupt service routine a. must not reference global variables (shared data problem) b. must be written in assembler (to avoid compiler optimizations) c. must not call routines that perform I/O duestion 8 Which of the following statements is correct? The shared data problem can be solved through a. RRI b. FQS c. RR d. RTOS Question 9 Which of the following statements is correct? The shared data problem can be solved through a. using the extem keyword d. using	
C. system response time     Question 3     Which of the following statements is correct? Interrupts can be disabled in order to     a. protect actritical section     b. enable context switches     c. protect other interrupts     d. disable a critical section     Question 4     How can a low priority task prevent itself from being interrupted by a high priority task?     a. By using critical sections     b. By avoiding critical sections     c. By enabling interrupts     d. disable a critical sections     b. By avoiding critical sections     c. By enabling interrupts     d. By disabling the interrupts     d. a clear the context upon entrance     d. restore the context and return     c. save the context and return     c. save the context and return     c. save the context and return     c. action the lowest-priority interrupt and return     d. restore the lowest-priority interrupt and return     Cuestion 5     tis more complex than RR     c. critical sections sub to used     d. the reform of poly interrupts is correct? An interrupt service routine     must not reference of poly aviables (shared data problem)     b. must be written in assembler (to avoid compiler optimizaitions)     e. must not call routines that perform I/O     duestion 7     Which of the following statements is correct? An interrupt service routine     a. must not call routines that perform I/O     cuestion 9     Which of the following statements is correct? The shared data problem)     b. must be written in assembler (to avoid compiler optimizaitions)     e. must not call routines that perform I/O     cuestion 9     Which of the following statements is correct? The shared data problem     duestion 9     Which of the following statements holds for the FOS architecture?     c. using the exter keyword     duestion 19	
d. processor response time     Question 3     Which of the following statements is correct? Interrupts can be disabled in order to     a. protect a critical section     context switches     c. protect other interrupts     d. disable a critical section     Question 4     How can a low priority task prevent itself from being interrupted by a high priority task?     a. By using critical sections     c. By enabling interrupts     d. disable a critical sections     c. By enabling interrupts     d. disable a critical sections     c. By enabling interrupts     d. disable a critical sections     c. By enabling interrupts     d. disable a critical sections     c. By enabling interrupts     d. disable a critical sections     c. By enabling interrupts     d. disable a critical sections     c. By enabling interrupts     d. disable a critical sections     c. By enabling interrupts     d. elsar the context to disk upon entrance     d. restore the context and return     c. save the context to disk upon entrance     d. restore the lowest-priority interrupt and return     Cuestion 6     The primary shortcorning for RRI architecture is:     a. all the tasks have the same priority     b. it is more complex than RR     c. critical sections must be used     d. the memory foolprint increases     Question 7     Which of the following statements is correct? An interrupt service routine     a. must not call routines that perform I/O     d. must return within 100 ms to meet user perception     Question 8     Which of the following statements is correct? The shared data problem can be solved through     a. FIOS     Question 9     Which of the following statements is correct? The shared data problem can be solved through     a. using the extent keyword     d. using the extent keyword	
Question 3           Which of the following statements is correct? Interrupts can be disabled in order to           a. protect a critical section           b. enable context switches           c. protect other interrupts           d. disable a critical section           Question 4           How can a low priority task prevent itself from being interrupted by a high priority task?           a. By using critical sections           b. By avoiding critical sections           cal subling the interrupts           d. disable a critical sections           cal subling the interrupts           d. dear the context upon entrance           b. restore the context and return           c. save the context to disk upon entrance           d. restore the lowest-priority interrupt and return           Question 6           The primary shortcoming for RRI architecture is:           a. all the tasks have the same priority           b. it is more complex than RR           c. critical sections must be used           d. the memory footprint increases           Question 7           Which of the following statements is correct? An interrupt service routine           must not call routines that perform I/O           d. must not reference global variables (shared data problem)           b. must teall routines that perform I/O <td></td>	
Which of the following statements is correct? Interrupts can be disabled in order to           a. protect a critical section           b. enable context switches           c. disable a critical section           Question 4           How can a low priority task prevent itself from being interrupted by a high priority task?           a. By using critical sections           b. By avoiding critical sections           c. By enabling interrupts           d. Bisbling the interrupts           Question 5           Which of the following statements is correct? An interrupt service routine is supposed to           a. clear the context upon entrance           d. restore the context and return           Question 6           The primary shortcoming for RRI architecture is:           a. all the tasks have the same priority           b. it is more complex than RR           c. critical sections must be used           d. the memory footprint increases           Question 7           Which of the following statements is correct? An interrupt service routine           a. must not reference global variables (shared data problem)           b. must not reference global variables (shared data problem)           b. must not call routines that perform I/O           d. must not call routines that perform I/O           d. must not call routines that perf	
a. protect a critical section     b. enable context switches     c. protect other interrupts     d. disable a critical section     Question 4     How can a low priority task prevent itself from being interrupted by a high priority task?     a. By using critical sections     b. By avoiding critical sections     c. By enabling interrupts     d. By disabling the interrupts     Question 5     Which of the following statements is correct? An interrupt service routine is supposed to     a. clear the context upon entrance     d. restore the lowest-priority interrupt and return     Question 6     The primary shortcoming for RRI architecture is:     a. all the tasks have the same priority     b. tr is more complex than RR     c. critical sections tasements is correct? An interrupt service routine     a. clear the lowest-priority interrupt and return     Question 6     The primary shortcoming for RRI architecture is:     a. all the tasks have the same priority     b. tr is more complex than RR     c. critical sections must be used     d. the memory footprint increases     Question 7     Which of the following statements is correct? An interrupt service routine     a. must not reference global variables (shared data problem)     must be written in assembler (to avoid compiler optimizations)     c. must not call routines that perform I/O     d. must return within 100 ms to meet user perception     Question 8     Which of the following statements is correct? The shared data problem can be solved through     a. using semaphores     b. enabling interrupts     cusing the extern keyword     d. Isros     Question 9     Which of the following statements is correct? The shared data problem can be solved through     a. using semaphores     b. enabling interrupt     Which of the following statements is correct? The shared data problem can be solved through     a. using semaphores     b. enabling interrupt     Which of the following statements is correct? The shared data problem can be solved through     a. using semaphores	
<ul> <li>b. enable context switches</li> <li>c. protect other interrupts</li> <li>d. disable a critical section</li> </ul> Question 4 How can a low priority task prevent itself from being interrupted by a high priority task? <ul> <li>a. The shared data problem can be solved through <ul> <li>a. RRI</li> <li>b. FogS</li> <li>c. RR</li> <li>c. RTOS</li> </ul> </li> <li>Question 9</li> <li>Which of the following statements is correct? The shared data problem can be solved through <ul> <li>a. using the static keyword</li> </ul> </li> <li>Question 9</li> <li>Which of the following statements is correct? The shared data problem can be solved through <ul> <li>a. using the static keyword</li> </ul> </li> <li>Question 9</li> <li>Which of the following statements holds for the FOS architecture? <ul> <li>a. the code length of the lower priority tasks does not affect the execution time of other tasks</li> <li>b. ecole length of the lower priority tasks does not affect the execution time of other tasks</li> <li>b. the code length of the lower priority tasks does not affect the execution time of other tasks</li> &lt;</ul></li>	a. protect a critical section
disable a critical section         Question 4         How can a low priority task prevent itself from being interrupted by a high priority task?         a. By using critical sections         b. By avoiding critical sections         c. By enabling interrupts         d. By disabling the interrupts         Question 5         Which of the following statements is correct? An interrupt service routine is supposed to         a. clear the context upon entrance         b. restore the context and return         Question 6         The primary shortcoming for RRI architecture is:         a. all the tasks have the same priority         b. it is more complex than RR         c. critical sections must be used         d. the memory footprint increases         Question 7         Which of the following statements is correct? An interrupt service routine         a. must not reference global variables (shared data problem)         b. must be written in assembler (to avoid compiler optimizaitions)         c. must not reference global variables (shared data problem)         b. must not call routines that perform I/O         d. must not call routines that perform I/O         d. must return within 100 ms to meet user perception         Question 8         Which of the following statements is correct? The shared data problem can be solved throu	b. enable context switches
Question 4         How can a low priority task prevent itself from being interrupted by a high priority task?         a. By using critical sections         b. By avoiding critical sections         c. By disabling the interrupts         Question 5         Which of the following statements is correct? An interrupt service routine is supposed to         a. clear the context upon entrance         b. restore the context upon entrance         c. restore the context and return         Question 6         The primary shortcoming for RRI architecture is:         a. all the tasks have the same priority         b. it is more complex than RR         c. critical sections must be used         d. the memory tooprint increases         Question 7         Which of the following statements is correct? An interrupt service routine         a. must not reference global variables (shared data problem)         b. must not reference global variables (shared data problem)         c. must not reference global variables (shared data problem)         c. must not reference global variables (shared data problem)         b. must not reference global variables (shared data problem)         c. must not reference global variables (shared data problem)         c. must not reference global variables (shared data problem)         c. must not call routines that perform I/O	c. protect other interrupts
How can a low priority task prevent itself from being interrupted by a high priority task? a. By using critical sections b. By avoiding critical sections c. By enabling interrupts d. By disabling the interrupts Guestion 5 Which of the following statements is correct? An interrupt service routine is supposed to a. clear the context and return c. save the context and return Guestion 6 The primary shortcoming for RRI architecture is: a. all the tasks have the same priority b. it is more complex than RR c. critical sections must be used d. the memory footprint increases Question 7 Which of the following statements is correct? An interrupt service routine a. must not reference global variables (shared data problem) b. must be written in assembler (to avoid compiler optimizations) c. must not reference global variables (shared data problem) d. must return within 100 ms to meet user perception Question 8 Which architecture has the best response time for task code? a. RR d. RTOS Question 9 Which of the following statements is correct? The shared data problem can be solved through a. using the atter keyword d. using the atterways and and the data problem can be solved through a. using the extern within 100 ms to meet user perception Question 8 Which of the following statements is correct? The shared data problem can be solved through a. using the extern keyword d. using the extern keyword d. using the attic keyword Question 10 Which of the following statements holds for the FQS architecture? a. the code length of the lower priority tasks does not affect the execution time of other tasks b. the code length of the higher priority tasks does not affect the execution time of other tasks b. the code length of the higher priority tasks does not affect the execution time of other tasks b. the code length of the higher priority tasks does not affect the execution time of other tasks b. the code length of the higher priority tasks does not affect the execution time of other tasks b. the code length of the linter priority tasks d	
How can a low priority task prevent itself from being interrupted by a high priority task? a. By using critical sections b. By avoiding critical sections c. By enabling interrupts d. By disabling the interrupts Guestion 5 Which of the following statements is correct? An interrupt service routine is supposed to a. clear the context and return c. save the context and return Guestion 6 The primary shortcoming for RRI architecture is: a. all the tasks have the same priority b. it is more complex than RR c. critical sections must be used d. the memory footprint increases Question 7 Which of the following statements is correct? An interrupt service routine a. must not reference global variables (shared data problem) b. must be written in assembler (to avoid compiler optimizations) c. must not reference global variables (shared data problem) d. must return within 100 ms to meet user perception Question 8 Which architecture has the best response time for task code? a. RR d. RTOS Question 9 Which of the following statements is correct? The shared data problem can be solved through a. using the atter keyword d. using the atterways and and the data problem can be solved through a. using the extern within 100 ms to meet user perception Question 8 Which of the following statements is correct? The shared data problem can be solved through a. using the extern keyword d. using the extern keyword d. using the attic keyword Question 10 Which of the following statements holds for the FQS architecture? a. the code length of the lower priority tasks does not affect the execution time of other tasks b. the code length of the higher priority tasks does not affect the execution time of other tasks b. the code length of the higher priority tasks does not affect the execution time of other tasks b. the code length of the higher priority tasks does not affect the execution time of other tasks b. the code length of the higher priority tasks does not affect the execution time of other tasks b. the code length of the linter priority tasks d	Question 4
<ul> <li>a. By using critical sections</li> <li>b. By avoiding critical sections</li> <li>c. By enabling interrupts</li> <li>Question 5</li> <li>Which of the following statements is correct? An interrupt service routine is supposed to</li> <li>a. clear the context upon entrance</li> <li>b. restore the context of disk upon entrance</li> <li>c. restore the context of disk upon entrance</li> <li>d. guestion 6</li> <li>The primary shortcoming for RRI architecture is:</li> <li>a. all the tasks have the same priority</li> <li>b. it is more complex than RR</li> <li>c. critical sections must be used</li> <li>d. the memory footprint increases</li> <li>Question 7</li> <li>Which of the following statements is correct? RRI</li> <li>b. FQS</li> <li>c. RR</li> <li>d. RTOS</li> <li>Question 9</li> <li>Which of the following statements is correct? The shared data problem can be solved through <ul> <li>a. using semaphores</li> <li>b. enabling interrupts</li> <li>c. using the extern keyword</li> <li>d. using the extern keyword</li> <li>d. using the static keyword</li> </ul> </li> <li>d. using the extern keyword</li> <li>d. using the extern keyword</li> <li>d. using the extern keyword</li> <li>d. the code length of the lower priority tasks does not affect the execution time of other tasks</li> <li>b. the code length of the holyer priority tasks does not affect the execution time of other tasks</li> <li>b. the code length of the higher priority tasks, the code for lower priority tasks should be small</li> </ul>	
d.       By disabling the interrupts         Question 5         Which of the following statements is correct? An interrupt service routine is supposed to <ul> <li>a. clear the context upon entrance</li> <li>b. restore the context to disk upon entrance</li> <li>d. restore the lowest-priority interrupt and return</li> </ul> Question 6         The primary shortcoming for RRI architecture is: <ul> <li>a. all the tasks have the same priority</li> <li>b. it is more complex than RR</li> <li>c. critical sections must be used</li> <li>d. the memory footprint increases</li> </ul> Question 7         Which of the following statements is correct? An interrupt service routine         a. must not reference global variables (shared data problem)         b. must be written in assembler (to avoid compiler optimizaitions)         c. must not reference global variables (shared data problem)         b. must be written in assembler (to avoid compiler optimizaitions)         c. must not reference global variables (shared data problem)         b. must not reference global variables (shared data problem)         b. must not call routines that perform <i>I/O</i> d. must return within 100 ms to meet user perception         Question 8         Which architecture has the best response time for task code?         a. RRI         b. FQS	
Question 5           Which of the following statements is correct? An interrupt service routine is supposed to           a.         clear the context and return           b.         restore the context and return           clear the context and return         Question 6           The primary shortcoming for RRI architecture is:         a.           a.         all the tasks have the same priority           b.         it is more complex than RR           c.         critical sections must be used           d.         the memory footprint increases           Question 7         Which of the following statements is correct? An interrupt service routine           a.         must not reference global variables (shared data problem)           b.         must not call routines that perform I/O           d.         must return within 100 ms to meet user perception           Question 8         Which architecture has the best response time for task code?           a.         RRI           b.         FQS           c.         RR           d.         RTOS           Question 9         Which of the following statements is correct? The shared data problem can be solved through           a.         using semaphores           b.         enabling interrupts           c. <td></td>	
Which of the following statements is correct? An interrupt service routine is supposed to         a. clear the context upon entrance         b. restore the context and return         c. save the context to disk upon entrance         d. restore the lowest-priority interrupt and return         Question 6         The primary shortcoming for RRI architecture is:         a. all the tasks have the same priority         b. it is more complex than RR         c. critical sections must be used         d. the memory footprint increases         Question 7         Which of the following statements is correct? An interrupt service routine         a. must not reference global variables (shared data problem)         b. must be written in assembler (to avoid compiler optimizaitions)         c. must not call routines that perform I/O         d. must return within 100 ms to meet user perception         Question 8         Which architecture has the best response time for task code?         a. RRI         b. FQS         c. using semaphores         b. enabling interrupts         c. using the extern keyword         d. using the static keyword         Question 10         Which of the following statements holds for the FQS architecture?         a. the code length of the lower priority tasks does not affect the execut	
<ul> <li>a. clear the context upon entrance</li> <li>b. restore the context and return</li> <li>c. save the context to disk upon entrance</li> <li>d. restore the lowest-priority interrupt and return</li> <li>Question 6</li> <li>The primary shortcoming for RRI architecture is: <ul> <li>a. all the tasks have the same priority</li> <li>b. it is more complex than RR</li> <li>c. critical sections must be used</li> <li>d. the memory footprint increases</li> </ul> </li> <li>Question 7</li> <li>Which of the following statements is correct? An interrupt service routine <ul> <li>a. must not reference global variables (shared data problem)</li> <li>b. must per visual to the perform I/O</li> <li>d. must return within 100 ms to meet user perception</li> </ul> </li> <li>Question 8</li> <li>Which architecture has the best response time for task code? <ul> <li>a. RRI</li> <li>b. FQS</li> <li>c. RR</li> <li>d. RTOS</li> </ul> </li> <li>Question 9</li> <li>Which of the following statements is correct? The shared data problem can be solved through <ul> <li>a. using semaphores</li> <li>b. enabling interrupts</li> <li>c. using the extern keyword</li> <li>d. using the static keyword</li> <li>Question 10</li> </ul> </li> <li>Which of the following statements holds for the FQS architecture? <ul> <li>a. the code length of the lower priority tasks does not affect the execution time of other tasks</li> <li>b. the code length of the higher priority tasks, the code for lower priority tasks should be small</li> </ul> </li> </ul>	
<ul> <li>b. restore the context and return</li> <li>c. save the context to disk upon entrance</li> <li>d. restore the lowest-priority interrupt and return</li> <li>Question 6</li> <li>The primary shortcoming for RRI architecture is: <ul> <li>a. all the tasks have the same priority</li> <li>b. it is more complex than RR</li> <li>c. critical sections must be used</li> <li>d. the memory footprint increases</li> </ul> </li> <li>Question 7</li> <li>Which of the following statements is correct? d.       restore the lowest-priority interrupt and return         Question 6         The primary shortcoming for RRI architecture is:         a.       all the tasks have the same priority         b.       it is more complex than RR         c.       critical sections must be used         d.       the memory footprint increases         Question 7         Which of the following statements is correct? An interrupt service routine         a.       must not reference global variables (shared data problem)         b.       must not reference global variables (shared data problem)         c.       must not call routines that perform I/O         d.       must not call routines that perform I/O         d.       must return within 100 ms to meet user perception         Question 8       Which architecture has the best response time for task code?         a.       RRI         b.       FQS         c.       RR         b.       FQS         Question 9       Which of the following statements is correct? The shared data problem can be solved through         a.       using semaphores         b.       enabling interrupts         c.       using the extern keyword         d.       using the static keyword         Q	
Question 6         The primary shortcoming for RRI architecture is:         a. all the tasks have the same priority         b. it is more complex than RR         c. critical sections must be used         d. the memory footprint increases         Question 7         Which of the following statements is correct? An interrupt service routine         a. must not reference global variables (shared data problem)         b. must be written in assembler (to avoid compiler optimizaitions)         c. must not call routines that perform I/O         d. must return within 100 ms to meet user perception         Question 8         Which architecture has the best response time for task code?         a. RRI         b. FQS         c. RR         d. <b>RTOS</b> Question 9         Which of the following statements is correct? The shared data problem can be solved through         a. using semaphores         b. enabling interrupts         c. using the extern keyword         d. using the static keyword         Question 10         Which of the following statements holds for the FQS architecture?         a. the code length of the lower priority tasks does not affect the execution time of other tasks         b. the code length of the lower priority tasks does not affect the execution time of other tasks <td>c. save the context to disk upon entrance</td>	c. save the context to disk upon entrance
Question 6         The primary shortcoming for RRI architecture is:         a. all the tasks have the same priority         b. it is more complex than RR         c. critical sections must be used         d. the memory footprint increases         Question 7         Which of the following statements is correct? An interrupt service routine         a. must not reference global variables (shared data problem)         b. must be written in assembler (to avoid compiler optimizaitions)         c. must not call routines that perform I/O         d. must return within 100 ms to meet user perception         Question 8         Which architecture has the best response time for task code?         a. RRI         b. FQS         c. RR         d. <b>RTOS</b> Question 9         Which of the following statements is correct? The shared data problem can be solved through         a. using semaphores         b. enabling interrupts         c. using the extern keyword         d. using the static keyword         Question 10         Which of the following statements holds for the FQS architecture?         a. the code length of the lower priority tasks does not affect the execution time of other tasks         b. the code length of the lower priority tasks does not affect the execution time of other tasks <td>d. restore the lowest-priority interrupt and return</td>	d. restore the lowest-priority interrupt and return
The primary shortcoming for RRI architecture is: a. all the tasks have the same priority b. it is more complex than RR c. critical sections must be used d. the memory footprint increases Question 7 Which of the following statements is correct? An interrupt service routine a. must not reference global variables (shared data problem) b. must be written in assembler (to avoid compiler optimizaitions) c. must not call routines that perform I/O d. must return within 100 ms to meet user perception Question 8 Which architecture has the best response time for task code? a. RRI b. FQS c. RR d. RTOS Question 9 Which of the following statements is correct? The shared data problem can be solved through a. using semaphores b. enabling interrupts c. using the extern keyword d. using the static keyword Question 10 Which of the following statements holds for the FQS architecture? a. the code length of the lower priority tasks does not affect the execution time of other tasks b. the code length of the higher priority tasks, does not affect the execution time of other tasks b. the code length of the higher priority tasks, the code for lower priority tasks should be small	
<ul> <li>a. all the tasks have the same priority</li> <li>b. it is more complex than RR</li> <li>c. critical sections must be used</li> <li>d. the memory footprint increases</li> <li>Question 7</li> <li>Which of the following statements is correct? An interrupt service routine</li> <li>a. must not reference global variables (shared data problem)</li> <li>b. must be written in assembler (to avoid compiler optimizaitions)</li> <li>c. must not call routines that perform I/O</li> <li>d. must return within 100 ms to meet user perception</li> <li>Question 8</li> <li>Which architecture has the best response time for task code?</li> <li>a. RRI</li> <li>b. FQS</li> <li>c. RR</li> <li>d. RTOS</li> <li>Question 9</li> <li>Which of the following statements is correct? The shared data problem can be solved through</li> <li>a. using semaphores</li> <li>b. enabling interrupts</li> <li>c. using the extern keyword</li> <li>d. using the static keyword</li> <li>d. the code length of the lower priority tasks does not affect the execution time of other tasks</li> <li>b. the code length of the higher priority tasks, the code for lower priority tasks should be small</li> </ul>	The primary shortcoming for RRI architecture is:
<ul> <li>b. it is more complex than RR</li> <li>c. critical sections must be used</li> <li>d. the memory footprint increases</li> <li>Question 7</li> <li>Which of the following statements is correct? d.       the memory footprint increases         Question 7         Which of the following statements is correct? An interrupt service routine         a.       must not reference global variables (shared data problem)         b.       must be written in assembler (to avoid compiler optimizaitions)         c.       must not call routines that perform I/Q         d.       must return within 100 ms to meet user perception         Question 8       Which architecture has the best response time for task code?         a.       RRI         b.       FQS         c.       RR         d.       RTOS         Question 9       Which of the following statements is correct? The shared data problem can be solved through         a.       using semaphores         b.       enabling interrupts         c.       using the extern keyword         d.       using the static keyword         Question 10       Which of the following statements holds for the FQS architecture?         a.       the code length of the lower priority tasks does not affect the execution time of other tasks         b.       the code length of the lower priority tasks does not affect the execution time of other tasks	
Question 7         Which of the following statements is correct? An interrupt service routine         a. must not reference global variables (shared data problem)         b. must be written in assembler (to avoid compiler optimizaitions)         c. must not call routines that perform I/O         d. must return within 100 ms to meet user perception         Question 8         Which architecture has the best response time for task code?         a. RRI         b. FQS         c. RR         d. RTOS         Question 9         Which of the following statements is correct? The shared data problem can be solved through         a. using semaphores         b. enabling interrupts         c. using the extern keyword         Question 10         Which of the following statements holds for the FQS architecture?         a. the code length of the lower priority tasks does not affect the execution time of other tasks         b. the code length of the lower priority tasks does not affect the execution time of other tasks	
Which of the following statements is correct? An interrupt service routine         a. must not reference global variables (shared data problem)         b. must be written in assembler (to avoid compiler optimizaitions)         c. must not call routines that perform I/O         d. must return within 100 ms to meet user perception         Question 8         Which architecture has the best response time for task code?         a. RRI         b. FQS         c. RR         d. RTOS         Question 9         Which of the following statements is correct? The shared data problem can be solved through         a. using semaphores         b. enabling interrupts         c. using the extern keyword         d. using the static keyword         d. the code length of the lowe	
<ul> <li>a. must not reference global variables (shared data problem)</li> <li>b. must be written in assembler (to avoid compiler optimizaitions)</li> <li>c. must not call routines that perform I/O</li> <li>d. must return within 100 ms to meet user perception</li> <li>Question 8</li> <li>Which architecture has the best response time for task code?</li> <li>a. <ul> <li>b. the code length of the higher priority tasks does not affect the execution time of other tasks</li> <li>c. to reduce the response time of higher priority tasks, the code for lower priority tasks should be small</li> </ul>	
c. to reduce the response time of higher priority tasks, the code for lower priority tasks should be small	
c. to reduce the response time of higher priority tasks, the code for lower priority tasks should be small	
	b. the code length of the higher priority tasks does not affect the execution time of other tasks
	<ul> <li>b. the code length of the higher priority tasks does not affect the execution time of other tasks</li> <li>c. to reduce the response time of higher priority tasks, the code for lower priority tasks should be small</li> </ul>

Question 44
Question 11
Which factor determines the best response time of a system reacting on an interrupt?
a. The shortest period of time during which the interrupt is enabled.
b. The shortest period of time during which the interrupt is disabled.
c. The shortest period of time during which the context of the current task is restored.
d. The shortest period of time during which another high-priority task is executing.
Question 12
Who handles the signaling between the interrupt routines and the task code in RTOS?
a. the user
b. the ISR
c. the RTOS
d. it is done automatically
Question 13
Which of the following statements is correct?
a. An RR architecture provides interrupts and interrupt priorities.
b. We cannot have a shared data problem in an RRI architecture.
c. An FQS architecture supports task priorities.
d. An RTOS provides interrupt preemption whereas an FQS architecture does not.
Question 14
In an RTOS, tasks can be in state BLOCKED, READY or RUNNING. Which of the following statements
is true?
a. A task starts in the state RUNNING b. A task ends in the state READY All statements are false
c. A task can transition directly from BLOCKED to RUNNING
d. A task can transition directly from READY to BLOCKED
Question 15
For which kind of software architecture for embedded systems is the worst response time for task code
the execution time for the longest task code plus the execution time for interrupt routines?
a. Round-robin without interrupts
b. Round-robin with interrupts
c. Function-queue-scheduling
d. Real-time operating system
Question 16
Which of the following statements is false:
a. interrupts can be used for signaling between tasks
b. interrupts can be disabled in order to protect a critical section
c. semaphores can be used for solving shared data problems
d. semaphores can be used for signaling between tasks
Question 17
Which of the following statements is correct? A reentrant function
a. may never call other reentrant functions
b. may only use hardware in an atomic way
c. may not be shared by different tasks
d. cannot be stored on the stack
Question 18
Tasks in an RTOS are often structured as:
a. state machines with states stored in global variables and messages in their queues don't have any role
b. state machines with states stored in private variables and messages in their queues acting as events
c. RR architectures with messages triggering state changes
d. RRI architectures with interrupts advancing the state machine
Question 19
Which of the following principles of RTOS-based design is <b>false</b> ?
a. turning time-slicing off solves the data sharing problem
b. short interrupt routines are needed for a responsive system
c. more tasks help sometimes to encapsulate data more efficiently
d. it is recommended to use just the minimum necessary functionality from an RTOS
Question 20
Why should time-slicing be avoided in an RTOS?
a. It creates too many context switches
<ul> <li>b. It raises the complexity of the scheduler</li> <li>c. It makes the response time of tasks less predictable</li> </ul>
c. It makes the response time of tasks less predictable
d. Equally important tasks require equal processor attention

```
Question 21
Given the following RTOS (pseudo) code:
int temp1, temp2;
void isr_buttons(void) // arrive here if a button is pressed
{
  temp1 = X32_PERIPHERALS[PERIPHERAL_TEMP1];
  temp2 = X32_PERIPHERALS[PERIPHERAL_TEMP2];
}
main() {
  while (! program_done) {
    X32_display = ((temp1 & 0xff) << 8) | (temp2 & 0xff);
    if (temp1 != temp2) {
       !! shutdown plant
    }
  }
Which of the following statements is correct?
a. There is a potential deadlock problem in this code
b. There is a potential shared data problem in this code
c. There is a potential problem with respect to reentrancy in this code
   There is no potential problem in this code
d.
```

```
Question 22
```

Given the following (pseudo) code:

int done;

void isr\_button (void) // arrive here when button pressed/released

```
ł
  if (!! button pressed)
    done = 1;
}
void main (void)
{
   done = 0;
   while (!done) {
     printf ("Hello World\r\n");
     delay(10000);
   }
   printf ("done\r\n");
The program is uploaded onto the embedded system in the conventional way. Which of the following
statements is correct?
a. Sometimes, the program does not end if the button is not debounced.
   The program does not always show the same output if it is restarted without uploading it.
b.
c.
    Sometimes, the program does not end.
    The program ends always as soon as the button is pressed.
d.
```

Questions 22 25
Questions 23 – 25 Given is the following (pseudo) code, which reads the current values of 4 different buttons and acts
accordingly. The 4 buttons are all mapped to bits 03 of the button register. The buttons are already
debounced.
debourced.
void f1(void) { delay(1000); }
void f2(void) { delay(1000); }
void /2(void) { delay(2000); } void f3(void) { delay(3000); }
void /s(void) { delay(3000); }
Void 14(Void) { delay(4000), }
void main (void) {
while (1) {
if (buttons & 0x01) f1();
if (buttons & $0x02$ ) f2();
if (buttons & $0x02$ ) $f2()$ ;
if (buttons & 0x04 ) 16(); if (buttons & 0x08 ) f4();
delay(1000);
}
Question 23
None of the buttons has been pressed. Which of the following statements is correct? The longest time
that button #3 must be pressed in order to activate f3() once is
a) 1 second
b) 2 seconds
c) 3 seconds
d) 4 seconds
Question 24
None of the buttons has been pressed. 500 ms after button #3 has been pressed, button #1 and button
#4 are pressed (in this sequence) and held down. Which of the following statements is correct?
The sequence of executed functions is
a) f3(), f1(), f4()
b) $f_{3}(0), f_{4}(0), f_{1}(1)$
c) f3(), and the remaining sequence cannot be determined
d) arbitrary
Question 25
At a given moment in time, the system is in an arbitrary state. Which of the following statements is
correct?
a) Button #1 must be pressed at most 9 s in order to activate f1().
b) Button #1 must be pressed at least 10 s in order to activate f1().
c) Button #1 must be pressed at most 10 s in order to activate f1().
d) Button #1 must be pressed at most 11 s in order to activate f1().

```
      Question 26

      Given the following RTOS (pseudo) code.

      ...

      void isr_button(void) { // arrive here when button pressed
delay(40); // wait for debounce
// do something -- takes 10 ms

      }

      void task(void) {
while (1) {
delay(100); // synchronize
f(); // perform function that takes 100 ms
}

      Pressing the button during synchronization will ...
a. extend the duration of synchronization by 10 ms
b. extend the duration of the synchronization by 20 ms
c. extend the duration of the synchronization by 50 ms
d. not have any delaying effect
```

Ouestions 27 20
Questions 27 – 28 Given is the following RTOS (pseudo) code with decreasing priorities T1 > T2 > T3:
<pre>void T1(void) {   while (1) {     OS_Pend(s_status);     !! control chemical process according to status     OS_Post(s_status);   } }</pre>
<pre>void T2(void) {     while (1) {         OS_Pend(s_temp);         !! read and update plant temperatures         OS_Post(s_temp);     } }</pre>
<pre>void T3(void) {     while (1) {         OS_Pend(s_status);         !! calculate and update the status         OS_Post(s_status);     } }</pre>
Question 27
<ul> <li>Which of the following statements is correct? There is</li> <li>a) a potential deadlock between T1 and T2</li> <li>b) a potential deadlock between T1 and T3</li> <li>c) a potential deadlock between T2 and T3</li> <li>d) no potential deadlock</li> </ul>
Question 28 Imagine that the priorities are exchanged, so that T1 < T2 < T3. Which of the following statements is correct? There is a) a potential deadlock between T1 and T2 b) a potential deadlock between T1 and T3 c) a potential deadlock between T2 and T3 d) no potential deadlock

## Question 29

Which of the following statements is correct regarding calling RTOS functions?

- a. a task may call the OS\_pend() routine, but not the OS\_post() routine
- b. an ISR may call the OS\_pend() routine, but not the OS\_post() routine
- c. an ISR may call the OS\_post() routine, but not the OS\_pend() routine d. an ISR may neither call the OS\_post(), nor the OS\_pend() routine

## Question 30

- Which of the following statements is correct about ISRs? a. The lowest-priority ISR runs **before** the highest-priority task
- b. The lowest-priority ISR runs after the highest-priority task
- c. ISRs are easier to debug than tasks
  d. ISRs exhibit less bugs/nr lines of code than normal routines
